Measurement of the energy spectrum of cosmic rays from the Pierre Auger Observatory

Paolo Privitera for The Pierre Auger Collaboration

The large sample of data collected by the Pierre Auger Observatory has led to a significant improvement over previous measurements of the energy spectrum of cosmic rays. We observe a suppression of the flux at the highest energy with a significance of more than 6 standard deviations. Two measurements of the energy spectrum, one based on the high-statistics surface detector data, and the other based on the hybrid data, where measurements from fluorescence and surface detectors are combined, are summarized.
