The supernova remnants IC443 and Cas A, have been recently detected in TeV energies with VERITAS, an array of four imaging atmospheric Cherenkov telescopes located at the Whipple Observatory at Mt. Hopkins in southern Arizona. Cas A has been observed during Fall 2007 for about 20 hours and IC 443 was observed during Spring 2007 with three telescopes and during Fall 2007 with the full four-telescope array. This presentation will be about the analysis results of this data and the physics implications of the results.

*VERITAS is supported by grants from the U.S. Department of Energy, the U.S. National Science Foundation and the Smithsonian Institution, by NSERC in Canada, by PPARC in the U.K. and by Science Foundation Ireland.
