AGILE reported a strongly variable gamma-ray source in Cygnus on ~2007-11-02 12:00 UT, with detected emission lasting only about 1 day. The variable source positional error box is centered at Galactic coordinates l = 75.0 deg, b = -0.4 deg, and has a radius of about 1 degree. This is near the position of the MILAGRO TeV source MGRO J2019+37. V. Segura et al. proposed the variable INTEGRAL source IGR J20188+3647 as a plausible counterpart of the flaring GeV source seen by AGILE. We carried out rapid follow-up observations of the IGR source location with XMM, VLA, and VERITAS; furthermore some INTEGRAL data in this region (taken about 12 days post-flare was also analyzed). We will report on results of this follow-up study.
